

2+ series, subequal or unequal, the outer sometimes forming calyculi. Florets 5 to 300+. Corollas yellow, orange, or white (sometimes with abaxial reddish stripes). Cypselae columnar or fusiform, ± 10-ribbed, beaked (*Agoseris*) or not. Pappi of (0)2 to 90 equal or unequal, smooth to barbellate (rarely plumose) bristles or bristle-tipped scales, persistent or caducous. Pollen echinolophate (Feuer & Tomb, 1977). Chromosome number $2n = 18, 27$ (triploid), or 36.

Included genera: *Agoseris* Rafinesque, *Microseris* D. Don, *Nothocalais* (A. Gray) Greene, *Stebbinsoseris* K. L. Chambers, *Uropappus* Nuttall.

Stephanomeriinae Stebbins ex Solbrig, Taxon 12: 235. 1963. TYPE: *Stephanomeria* Nuttall.

Annual or perennial herbs, or shrubs. Leaf blades linear, oblong, lanceolate, oblanceolate, obovate, or scale-like; margins entire, sinuate-dentate, lobed, or pinnatifid. Capitulescences corymbiform to thyrsoid-paniculiform. Receptacles not paleate, not bristly. Involucres narrowly cylindrical or obconic. Phyllaries usually in 2 series, unequal (outer forming calyculi), sometimes graduated (*Stephanomeria cichoriacea*). Florets 3 to 15 (to 30 in *Rafinesquia*) per capitulum. Corollas pink, purple, or white. Cypselae clavate, columnar, or fusiform, smooth, sometimes grooved or ≤ 5-ribbed, beaked (*Rafinesquia*) or not. Pappi of 5 to 20+ equal or unequal (*Prenanthesella*), plumose (*Rafinesquia*, *Stephanomeria*), or barbellate, persistent, or deciduous (*Munzothamnus*) bristles. Pollen echinate (Tomb et al., 1974). Chromosome number $2n = 14$ (*Prenanthesella*), 16, 24 (triploid), or 32.

Included genera: *Munzothamnus* P. H. Raven, *Pleiacanthus* Rydberg, *Prenanthesella* Rydberg, *Rafinesquia* Nuttall, *Stephanomeria* Nuttall.

Glyptopleurinae Joongku Lee & B. G. Baldwin, subtribus nov. TYPE: *Glyptopleura* D. C. Eaton.

Herbae annuae. Laminae foliorum spatulatae vel oblongae, profunde lobatae vel pinnatifidae; margines albi, scariosi, dentati vel setoso-ciliati. Capitula portata singulatim vel capitulescentiae parce ramosae. Receptacula epaleata, non setosa. Involucra cylindracea vel urceolata, ad bases bracteis spatulatis marginibus albis, scariosis, dentatis. Phyllaria 2-seriata, ± aequalia. Flosculi 7–16. Corollae cremeae vel luteolae (in sicco subroseae). Cypselae clavatae, tuberculatae, valde costatae, rostratae. Pappi constati ex setis 100+, aequalibus, barbellatis, extimus decidui. Pollina echinata. $2n = 18$.

Annual herbs. Leaf blades spatulate to oblong, deeply lobed to pinnatifid; margins white, scarious, dentate or setose-ciliate. Capitula borne singly or

capitulescences sparingly branched. Receptacles not paleate, not bristly. Involucres cylindrical to urceolate, at base with spatulate bracts with margins white, scarious, toothed. Phyllaries 2-seriate, ± equal. Florets 7 to 16 per capitulum. Corollas cream-colored to light yellow (when dry, pink). Cypselae clavate, tuberculate, strongly ribbed, beaked. Pappi of 100+ equal, barbellate bristles, the outermost deciduous. Pollen echinate (Tomb et al., 1974). Chromosome number $2n = 18$.

Included genus: *Glyptopleura* D. C. Eaton.

Krigiinae Joongku Lee & B. G. Baldwin, subtribus nov. TYPE: *Krigia* Schreber.

Herbae annuae vel perennes. Laminae foliorum lineares, oblongae, lanceolatae, vel oblanceolatae; margines integri, lobati, vel pinnatifidi. Capitula portata singulatim vel capitulescentiae cymosae vel interdum superne subumbellatae. Receptacula epaleata. Involucra turbinata, campanulata, vel urceolata. Phyllaria 1–2+-seriata, aequalia. Flosculi 4–30. Corollae flavae vel aurantiaceae. Cypselae columnares vel ovoideae, 10–20-nervatae vel costatae, non rostratae. Pappi nulli vel ex squamis 5+ constati (interdum fascientibus coronis minutis), plerumque cingentibus setis 5+, inaequalibus, spiculatis. Pollina echinolophata. $2n = 8, 10, 12, 18, 20, 30$, vel 60.

Plants annual or perennial herbs. Leaf blades linear, oblong, lanceolate, or oblanceolate; margins entire, lobed, or pinnatifid. Capitula borne singly or capitulescences cymiform or subumbelliform. Receptacles not paleate. Involucres turbinate, campanulate, or urceolate. Phyllaries 1- or 2+-seriate, equal. Florets 4 to 30 per capitulum. Corollas yellow or orange. Cypselae columnar or ovoid, 10- to 20-nerved or -ribbed, not beaked. Pappi none or of 5+ scales (sometimes forming minute crowns), usually surrounding 5+, unequal, spiculate bristles. Pollen echinolophate (Feuer & Tomb, 1977). Chromosome number $2n = 8, 10, 12, 18, 20, 30$, or 60.

Included genus: *Krigia* Schreber.

Lygodesmiinae Joongku Lee & B. G. Baldwin, subtribus nov. TYPE: *Lygodesmia* D. Don.

Herbae annuae (*Shinnersoseride*) vel perennes. Laminae foliorum lineares vel lanceo-lineares (vel squamiformes distaliter); margines plerumque integri, interdum lobati. Capitula raro portata singulatim, capitulescentiae plerumque ramosissimae. Receptacula epaleata. Involucra cylindracea vel subcylindracea. Phyllaria 2-seriata, inaequalia (extimus fascientibus calyculis). Flosculi 5–12. Corollae subsrosaceae, purpureae, vel albae. Cypselae columnares vel fusiformes, laeves, striatae, rugosae, vel costatae, non rostratae. Pappi ex setis 24–250, aequalis, barbellatis (et squamis 5, subulatis in *Chaetadelpha*), constati omnibus persistentibus. Pollina echinata vel echinolophata (*Lygodesmia*). $2n = 12$ (*Shinnersoseride*) vel 18, vel 27 (triploideis).
