***Tragopogon afghanicus*** Rech. fil. & Köie, n. sp. — Fig. 128 und 129.

Verosimiliter biennis. Caulis 25—35 cm altus, erectus validus subsimplex vel profunde furcatus vel interdum a basi ramosus, ramis arcuato-erectis, internodiis brevibus crebre foliatus, tenuiter striatus, glaber, basin versus  $\pm$  violascenti-suffusus, superne flavescenti-virens, sensim valde clavato-incrassatus, pedunculo infra capitulum fructiferum in statu compresso interdum ultra 1 cm diametro. Folia basalia in statu fructifero jam emarcida diffracta; folia caulina basi eximie fere inflate vaginato-dilatata, striato-multinervia, glabra laevia, sensim tenuiter caudato-attenuata, elongata flaccida, simulac flavescenti- et glaucescenti-viridia, media et superiora caules subaequantia. Involucrum fructiferum 7—9 cm longum, pappum superans; phylla e basi dilatata 8—10 mm lata sensim longe caudato-attenuata, inferne membranaceo-marginata superne caudata flaccida, tenuiter multistriatonervosa, glabra laevia flavescenti-viridia, imprimis prope basin interdum  $\pm$  glaucescenti-pruinosus. Achaenia  $\pm$  15 mm longa, sectione transversali 4—5-angulata, tenuiter longitudinaliter striato-costata, securus costas scabrida vix muriculata, sensim in rostrum pallidum duplo longius sub pappo breviter clavato-incrassatum ibique floccosum sensim attenuata. Pappus flavesiensis plumosus inaequalis, ad 3 cm longus. — Differt a *T. Krascheninikowii* S. Nikit. habitu humili, pedunculis valde incrassatis, rostro quam achaenium duplo nec triplo longiore, pappo flavescente nec rufescente.
